

# DOCKER ECOSYSTEM

Panamax is a containerized app creator with an open-source app marketplace hosted in GitHub. Panamax provides a friendly interface for users of Docker, Fleet & CoreOS. With Panamax, you can easily create, share and deploy any containerized app no matter how complex it might be. Stitch together Docker containers. You can configure links, ports and environment variables, as well as organize your application services into categories. Save your application template to a git repository and share it with your friends. You can source your friends' template repositories or submit a pull request and have your template be canonical and accessible by anyone in the world. [www.panamax.io](http://www.panamax.io)

With the help of Docker executor for Mesos, Mesos can run and manage Docker containers in conjunction with Chronos and Mesosphere's Marathon Frameworks. [mesos.apache.org](http://mesos.apache.org)

Marathon is an Apache Mesos framework for long running applications. Given that you have Mesos running as the kernel for your datacenter, Marathon is the init or upstart daemon. Marathon provides a REST API for starting, stopping, and scaling applications. Marathon is written in Scala and can run in highly-available mode by running multiple copies. <http://mesosphere.github.io/marathon/>

A highly-available key value store for shared configuration and service discovery. [github.com/coreos/etcd](http://github.com/coreos/etcd)

Flynn is a "distribution" of components that out-of-the-box gives companies a reasonable starting point for an internal "platform" for running their applications and services. Flynn is the banner for a collection of independent projects that together make up a toolkit or loose framework for building distributed systems. Flynn is both a whole and many parts, depending on what is most useful for you. The common goal is to democratize years of experience and best practices in building distributed systems. It is the software layer between operators and developers that makes both their lives easier. [www.flynn.io](http://www.flynn.io)

Built on the Docker cluster management toolkit Citadel, Shipyard gives you the ability to manage Docker resources including containers, hosts and more. Shipyard differs from other management applications in that it promotes composability. At the core, Shipyard only manages Docker (containers, etc). However, using "Extension Images" you can add functionality such as application routing and load balancing, centralized logging, deployment and more. You decide which components to use that fit your needs. [shipyard-project.com](http://shipyard-project.com)

CoreOS is designed for security, consistency, and reliability. Instead of installing packages via yum or apt, CoreOS uses Linux containers to manage your services at a higher level of abstraction. A single service's code and all dependencies are packaged within a container that can be run on one or many CoreOS machines. [coreos.com](http://coreos.com)

Helios is a Docker orchestration platform for deploying and managing containers across an entire fleet. [github.com/spotify/helios](http://github.com/spotify/helios)

A docker centric package for scheduling containers on a docker cluster. [citadeltoolkit.org](http://citadeltoolkit.org)

Serf is a tool for cluster membership, failure detection, and orchestration that is decentralized, fault-tolerant and highly available. Serf runs on every major platform: Linux, Mac OS X, and Windows. It is extremely lightweight: it uses 5 to 10 MB of resident memory and primarily communicates using infrequent UDP messages. Serf only provides membership, failure detection, and user events. [www.serfdom.io](http://www.serfdom.io)

A tool for discovering and configuring services in your infrastructure. It provides several key features: Service Discovery, Health Checking, Key/Value Store, Multi Datacenter. [www.consul.io](http://www.consul.io)

Nomad is a tool for managing a cluster of machines and running applications on them. Nomad abstracts away machines and the location of applications, and instead enables users to declare what they want to run and Nomad handles where they should run and how to run them. Nomad ships as a single binary, both for clients and servers, and requires no external services for coordination or storage. Nomad combines features of both resource managers and schedulers into a single system. Nomad models infrastructure as groups of datacenters which form a larger region. Nomad was designed from the ground up to support global scale infrastructure. Nomad is distributed and highly available, using both leader election and state replication to provide availability in the face of failures. [www.nomadproject.io](http://www.nomadproject.io)

Prometheus is an open-source systems monitoring and alerting toolkit. It collects metrics from configured targets at given intervals, evaluates rule expressions, displays the results, and can trigger alerts if some condition is observed to be true. <http://prometheus.io>

Zenoss Control Center is an open source application management and orchestration system. Control Center can not only manage the Zenoss platform but other Docker applications, from a simple web application to a multi-tiered stateful application stack. Control Center is based on a service oriented architecture which enables applications to run as a set of distributed services that can span hosts, datacenters, and geographic regions. A simple declarative application template file is used to describe how an application is configured, deployed, managed and monitored. Declarative monitoring support is built into Control Center. Applications can be automatically monitored and modeled upon provisioning. [www.controlcenter.io](http://www.controlcenter.io)

Scout collects key performance metrics automatically. Scout automatically monitors new servers when they come online. Scout's agent includes a feather-weight StatsD collector. No separate monitoring server to manage: just install our agent and you've got monitoring. Scout's roles-based approach to grouping servers makes monitoring group of servers as easy as one server. [scoutapp.com](http://scoutapp.com)

High resolution, Streaming and historical analytics. Multidimensional metrics. Uses CollectD plugin for Docker. As soon as the docker-collectd-plugin is installed and CollectD is configured to send metrics to SignalFx, it will start reporting container metrics for the running containers on that host, with new containers being picked up automatically. [blog.signalfx.com/signalfx-is-proud-to-join-the-docker-ecosystem-technology-partner-program](http://blog.signalfx.com/signalfx-is-proud-to-join-the-docker-ecosystem-technology-partner-program)

Sysdig Cloud provide you full visibility inside every container, but you do it from outside the containers. The Sysdig Cloud agent is installed on the host OS or into its own privileged container. From here, Sysdig Cloud is able to collect the internal activity of every container, along with the broader context of the host system! And of course all the information is then correlated together across all of your distributed host systems - containerized or not. It provides a holistic view of your entire distributed infrastructure and full context into how containers interact with each other and with other components of your systems. [sysdig.com/distributed-container-monitoring-sysdig-cloud-revolution/](http://sysdig.com/distributed-container-monitoring-sysdig-cloud-revolution/)

Project Atomic facilitates application-centric IT architecture by providing an end-to-end solution for deploying containerized applications quickly and reliably, with atomic update and rollback for application and host alike. The core of Project Atomic is the Project Atomic Host. This is a lightweight operating system that has been assembled out of upstream RPM content. It is designed to run applications in Docker containers. Atomic taps gear to install and link Docker containers into systemd and coordinate these containers across hosts. [www.projectatomic.io](http://www.projectatomic.io)

Datadog Agent uses the native cgroup accounting metrics to gather CPU, memory, network and I/O metrics of the containers every 15 seconds before they are forwarded to Datadog. [www.datadoghq.com/integrations/#docker](http://www.datadoghq.com/integrations/#docker)

[community.appdynamics.com/t5/Exchange-Community-AppDynamics/Docker-Monitoring-Extension/idi-p/14749](http://community.appdynamics.com/t5/Exchange-Community-AppDynamics/Docker-Monitoring-Extension/idi-p/14749)

New Relic Docker Beta will enable the following features: Navigation between Application Performance Monitoring and Servers when applications are hosted within Docker containers. Granular visibility about containers and hosts that are running your APM-instrumented applications.CPU and Memory metrics rolled up by Docker image for a given host. A historical view of number of running containers of a given Docker image type. [discuss.newrelic.com/how-to-try-out-the-docker-beta/19478](http://discuss.newrelic.com/how-to-try-out-the-docker-beta/19478)

wagl is a DNS server which allows microservices running as containers on a distributed Docker Swarm cluster to find and talk to each other. It is minimalist and works as a drop-in container in your cluster. [github.com/ahmetalbalkan/wagl](http://github.com/ahmetalbalkan/wagl)

Built on Docker: a minimalist Linux distribution for running Docker containers. Docker is run directly on top of the Linux Kernel, and all user-space Linux services are distributed as Docker containers. There is no need to use a separate software package distribution mechanism for RancherOS itself.

An OS made of Containers: the Docker daemon runs as PID 1, the first process the kernel starts. It is responsible for initiating system services, such as udev, DHCP and the console. System Docker takes the place of the init system, such as sysvinit or systemd, in other Linux distributions. [rancher.com/rancher-os/](http://rancher.com/rancher-os/)

Provides infrastructure services such as multi-host networking, global and local load balancing, and volume snapshots. It integrates native Docker management capabilities such as Docker Machine and Docker Swarm. [www.rancher.io](http://www.rancher.io)
